

# GETTING STARTED WITH IMAGES

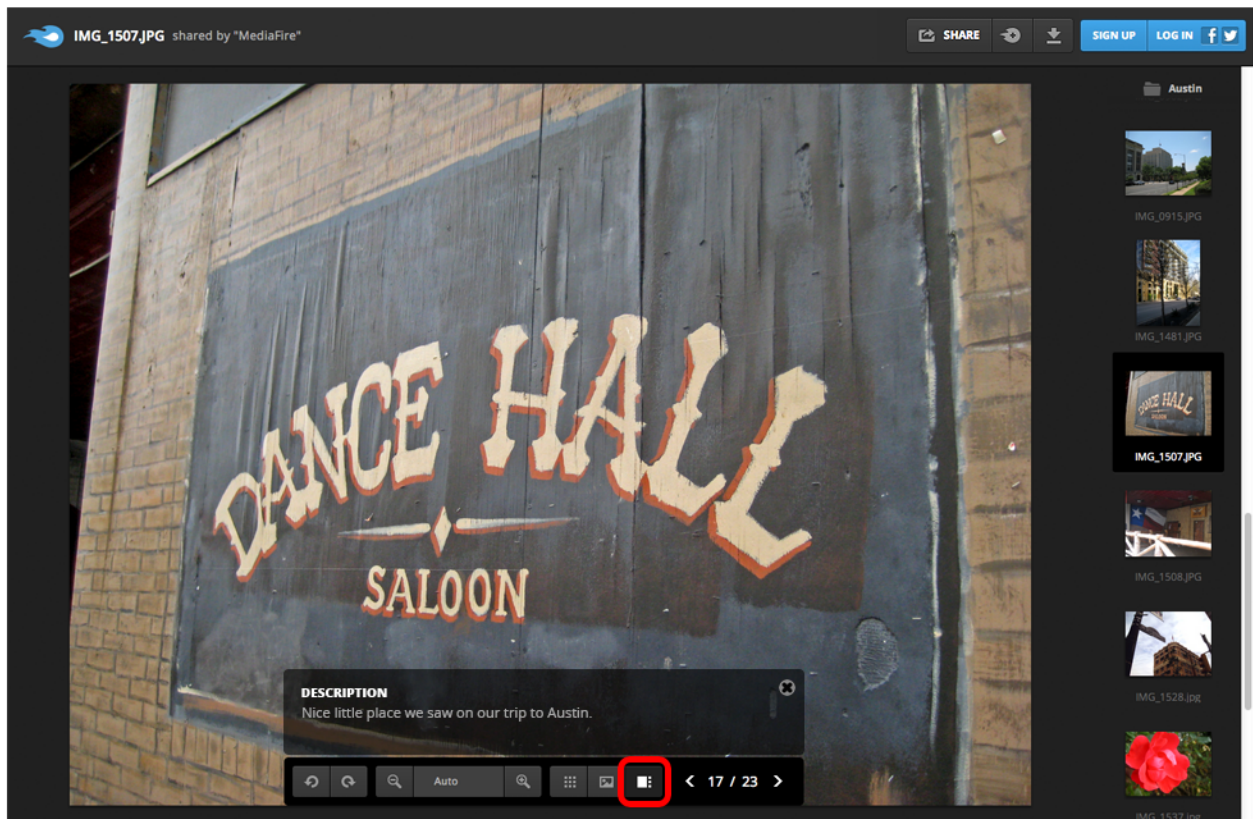

# Working with Pictures on MediaFire

MediaFire makes it easy for you to work with your pictures. With our image gallery, you can always view all your pictures in an eye-friendly size without having to download them first.

Simply left click on the image file on your "My Files" page and you will be immediately taken to an image gallery. Your images will be opened in the Film Strip mode by default, however two other options are available for you: Single Image mode and Gallery mode.

## Film Strip Mode

Film Strip mode displays your selected image in a big size with all other images from that folder appearing on the right side as a film strip. Thus you can easily jump to other pictures from the same folder just scrolling down with your mouse. You can also do that by clicking the arrows in the top right corner, or by using the keyboard shortcuts (Up/Left key for a previous photo and Down/Right key for next photo).

## Single Image Mode

Single Image mode displays only one image per page, however, you are still free to switch to other images by using the keyboard shortcuts available for filmstrip mode.

## Viewing Options

In both Film Strip and Single Image modes it is possible to view images in three different sizes - Auto, Original and Full screen, or zoom in and zoom out as much as you need.

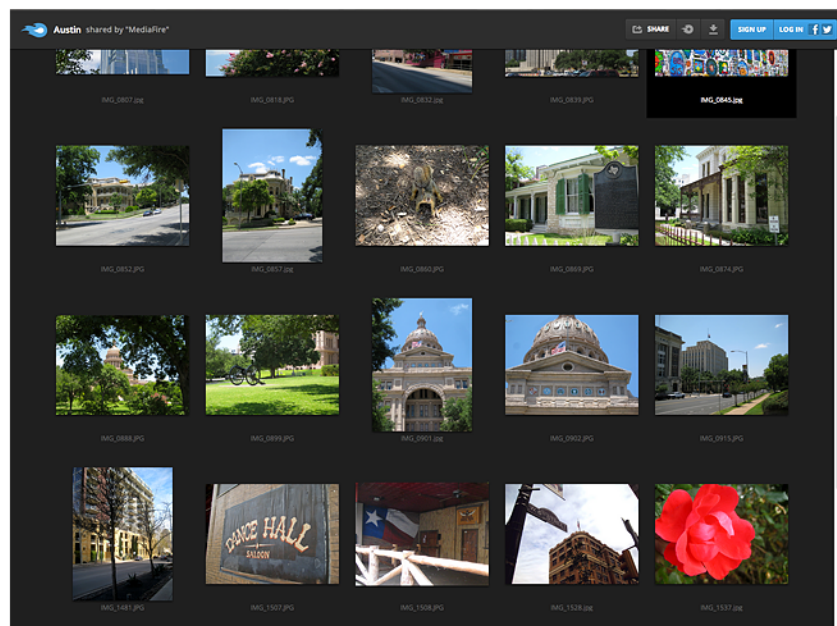

## Full Screen Mode

In Full Screen mode, you can navigate the folder images with the Up/Down/Left/Right keys, or the arrows displayed on both sides of the screen, and exit by simply pressing Esc or clicking the "X" in the top right corner.

## Gallery Mode

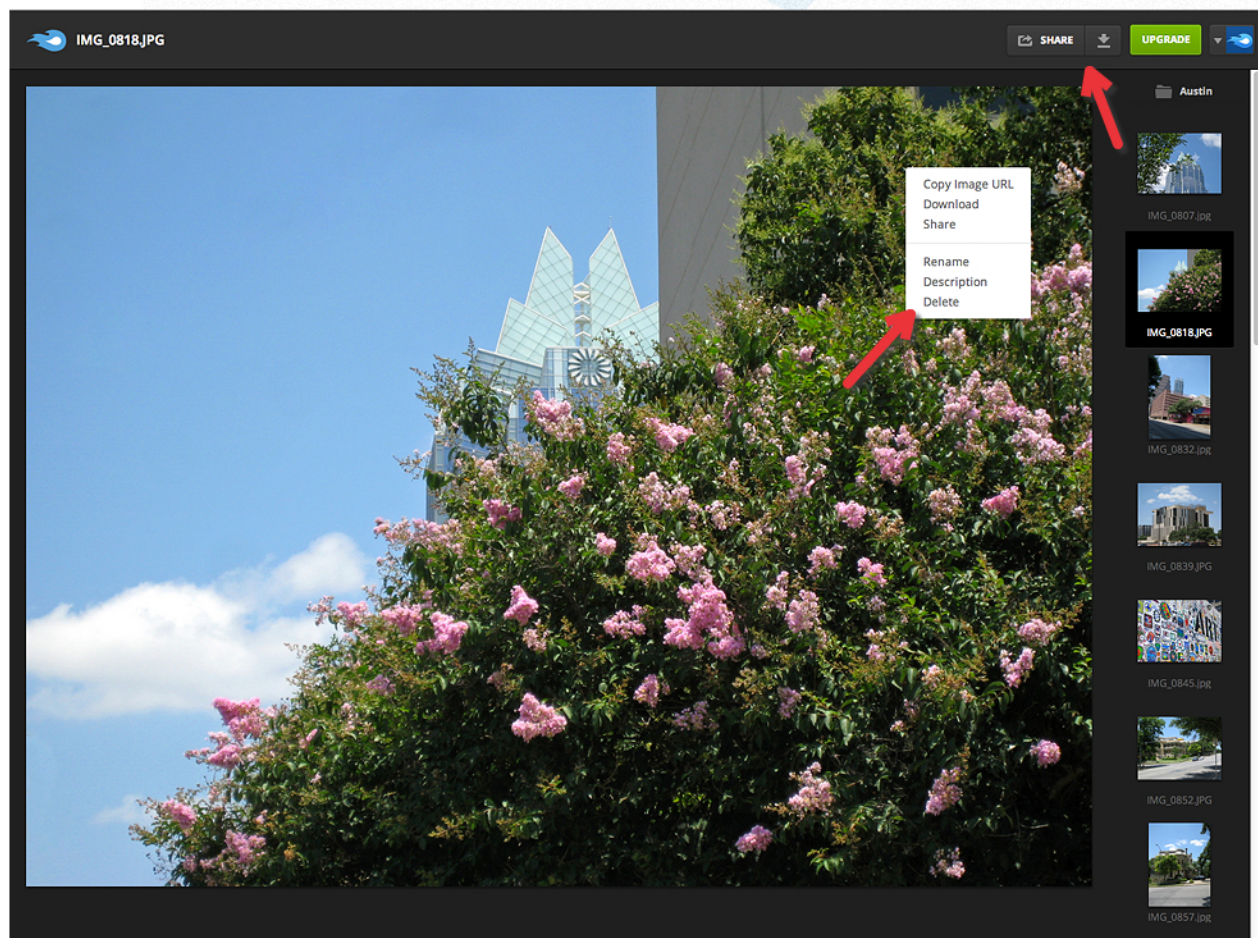

Gallery mode shows all of the pictures from your folder as thumbnails (you can choose between a small, medium, or a large size). From there you can left click on any image and it will be opened in the default Film Strip mode.

## Image Gallery File Functionality

Apart from image-related functions, the gallery also gives you some basic file functionality. Just right click on the main image or any image from the folder in the film strip on the right side, and you will get the menu that offers you to download, share, rename, describe or delete the picture. There are also large Share and Download buttons in the top right corner.

## Working with Multiple Images

You can also work with multiple images in the gallery. Simply hold the Ctrl key on Windows and Linux, or the Command key on OSX and select every image that you click on. If you have lots of images to work with, it could be helpful to select the images you need using the Shift key: by holding it, you can select all the images below the image where you started up to the image that you next click on the right side of the Gallery in the Film Strip mode. And once you've selected all the images you need, just right click on any of them to download them, share them or delete them (downloading multiple files is available for users with Personal, Professional and Business Accounts).

## Folder Operations

And finally, you get two functions for the entire folder of your choice in the image gallery: to share it or to download it as one file (this last feature is available for Professional and Business accounts). You'll find those two options when you click on the Share or Download button located at the top right of the page.
